

CLAIMS

We claim:

1. A teargas deploying device for removably mounting to a female receiver on a vehicle, said device comprising:
 - an elongated tubular member having a first end and a second end, said first end being closed and having a pointed shape, said second end being open, a plurality of apertures extending into said tubular member, each of said apertures being positioned generally adjacent to said first end;
 - a canister receiving housing being fluidly coupled to said second end and extending away therefrom, wherein a teargas canister may selectively be positioned into said housing;
 - a male bracket being attached to said housing for removably mounting said housing to the female receiver such that the tubular member extends away from the vehicle; and
 - wherein said first end of said tubular member may be extended through a wall such that teargas released from the canister may enter a dwelling bound by the wall.
2. The device of claim 1, wherein said housing has an opening positioned opposite of said tubular member for receiving the canister, a cover being removably attached to said housing for selectively opening or closing said opening.
3. The device of claim 1, wherein said male bracket includes a first arm and a second arm attached together at a generally perpendicular angle such that said first arm is vertically orientated and said second arm is horizontally orientated, said second arm having a free end being

removably extendable into said female receiver, said first arm having an upper end attached to said housing.

4. The device of claim 3, further including a stabilizing assembly being attached to said tubular member and said housing, said stabilizing assembly including a plurality of fins being attached to and extending along and abutting area of said tubular member and said housing, each of said fins radially extending outwardly from said tubular member and said housing.

5. The device of claim 1, further including a stabilizing assembly being attached to said tubular member and said housing, said stabilizing assembly including a plurality of fins being attached to and extending along and abutting area of said tubular member and said housing, each of said fins radially extending outwardly from said tubular member and said housing.

6. A teargas deploying device for removably mounting to a female receiver on a vehicle, said device comprising:
an elongated tubular member having a first end and a second end, said first end being closed and having a pointed shape, said second end being open, a plurality of apertures extending into said tubular member, each of said apertures being positioned generally adjacent to said first end;
a canister receiving housing being fluidly coupled to said second end and extending away therefrom, said housing having an opening positioned opposite of said tubular member, wherein a teargas canister may selectively be positioned through said opening and into said housing, a cover being removably

attached to said housing for selectively opening or closing said opening;

a male bracket being attached to said housing for removably mounting said housing to the female receiver such that the tubular member extends away from the vehicle, said male bracket including a first arm and a second arm attached together at a generally perpendicular angle such that said first arm is vertically orientated and said second arm is horizontally orientated, said second arm having a free end being removably extendable into said female receiver, said first arm having an upper end attached to said housing;

a stabilizing assembly being attached to said tubular member and said housing, said stabilizing assembly including a plurality of fins being attached to and extending along and abutting area of said tubular member and said housing, each of said fins radially extending outwardly from said tubular member and said housing; and

wherein said first end of said tubular member may be extended through a wall such that teargas released from the canister may enter a dwelling bound by the wall.

7. A teargas deploying device comprising:

an elongated tubular member having a first end and a second end, said first end being closed and having a pointed shape, said second end being open, a plurality of apertures extending into said tubular member, each of said apertures being positioned generally adjacent to said first end;

a canister receiving housing being fluidly coupled to said second end and extending away therefrom, said housing having an opening positioned opposite of said tubular member, wherein

a teargas canister may selectively be positioned through said opening and into said housing, a cover being removably attached to said housing for selectively opening or closing said opening;

a handle being attached to said housing; and

wherein said first end of said tubular member may be extended through a wall such that teargas released from the canister may enter a dwelling bound by the wall.
